

Toucan quick guide

Generated from CHEATSHEET.md and config/toucan.keymap at 8b18f18 on 2026-09-20

What moved

THUMB	BEFORE	NOW
left outer	Ctrl	Cmd
left middle	Opt	SYM (hold) / Space (tap)
left inner	NAV (hold) / Enter (tap)	Enter
right inner	Space	Space
right middle	SYM (hold) / Bspc (tap)	NAV (hold) / Bspc (tap)
right outer	Cmd	Cmd

Ctrl and Opt are now **home-row combos**, and the two layer thumbs swapped hands: SYM sits under the left thumb, NAV under the right.

On caps legended from [print/keycap-legends.pdf](#), each layer thumb shows the glyph it sends when **tapped**, with the layer it **holds** printed underneath.

Modifier combos

Press the two (or three) keys together, on the BASE layer.

COMBO	SENDS
S + D	Ctrl
D + F	Opt
S + D + F	Ctrl+Opt
J + K	Opt
K + L	Ctrl
J + K + L	Ctrl+Opt

They are sticky keys, so one binding covers both habits:

- Tap and release** → the modifier applies to the *next* key only, within 1.5 s. This is the one-off chord: S + D , release, D → **Ctrl+D**.
- Keep holding** → behaves like a normal held modifier for as long as you hold it.

They only fire on BASE, and need 150 ms of no typing beforehand, so words like "sad" and "desk" type normally.

On the legended caps a combo is drawn as or on the **edge facing the key you press it with**, and the bar running under S · D · F (and J · K · L) is the three-key Ctrl+Opt.

Everyday shortcuts

NAV below means: hold the right middle thumb. Tapping it instead sends Backspace.

NAV now lives on the *right* thumb while most of its keys (arrows, word jumps) are on the right hand, so these are same-hand rolls. If that turns out to be awkward, swapping NAV back to a left thumb is a one-line keymap change.

TASK	KEYS	SENDS
Word jump ← / →	NAV + U / O	Opt+← / Opt+→
Delete word	NAV + P	Opt+Backspace
Subword jump ← / →	NAV + hold F + J / L	Ctrl+Opt+← / →
Arrows	NAV + J K I L	← ↓ ↑ →
Line start / end	NAV + M / .	Home / End
Page up / down	NAV + Y / H	PgUp / PgDn

TASK	KEYS	SENDS
Undo / cut / copy / paste	NAV + Z / X / C / V	Cmd+Z / X / C / V
Lock screen	NAV + Q	Ctrl+Cmd+Q
Delete forward	NAV + ;	Del
Caps lock	NAV + G	Caps
Screenshot	NAV + W	PrintScreen

Ctrl+D -style chords use the combos instead: tap S + D , release, tap the letter.

Window management

Two routes, both Ctrl+Opt+arrow:

- NAV + hold F + arrow** — F is Ctrl+Opt on the NAV layer, J / K / I / L are the arrows. Use this one. It does not depend on a one-shot surviving a layer change.
- S + D + F (or J + K + L), release, then NAV + arrow** — relies on the sticky modifier staying alive across the NAV hold, which is untested on hardware. If it drops the modifier, use route 1.

Trackpad swipes (macOS mode, the default) are independent of layers:

SWIPE	SENDS
Up	Ctrl+Cmd+↑
Right	Ctrl+Cmd+→
Down	Ctrl+Cmd+↓
Left	Ctrl+Cmd+←

Pinch zoom sends Cmd+ = / Cmd+ = . Holding NAV or SYM turns trackpad movement into scrolling.

Typing your password

The characters moved, so here is where each class now lives:

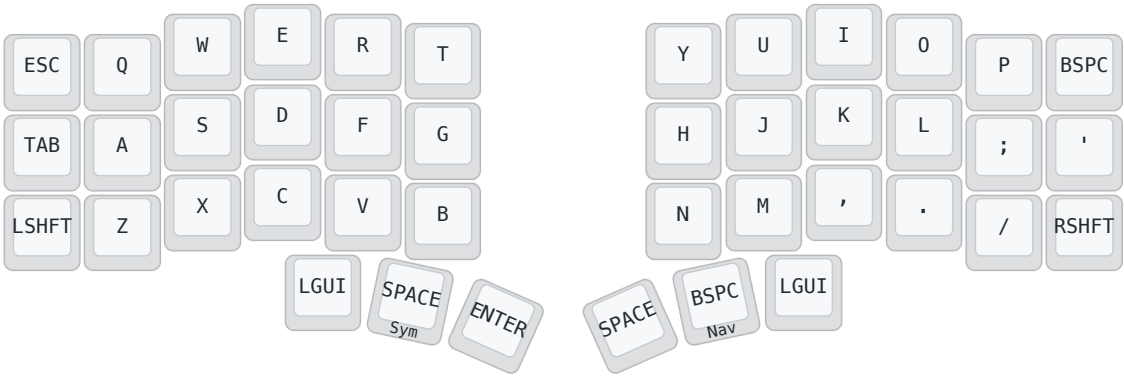

- Letters** — unchanged, BASE home row.
- Capitals** — hold either pinky Shift (SHIFT outer column, both hands).
- Digits** — **SYM** (hold left middle thumb; tapping it sends Space) + the top row: Q ... P = 1 ... 0 .
- ! @ # \$ %** — SYM + left home row A S D F G .
- ^ & * ()** — SYM + right home row H J K L ; .
- = - + { }** — SYM + left bottom row Z X C V B .
- [] ; : ** — SYM + right bottom row N M , . / .
- |** — SYM + ' (right pinky). **`** — SYM + ESC .
- Cmd** — outer left or outer right thumb. **Ctrl / Opt** — the home-row combos above.

Holding SYM through the whole symbol run is usually faster than tapping in and out of it.

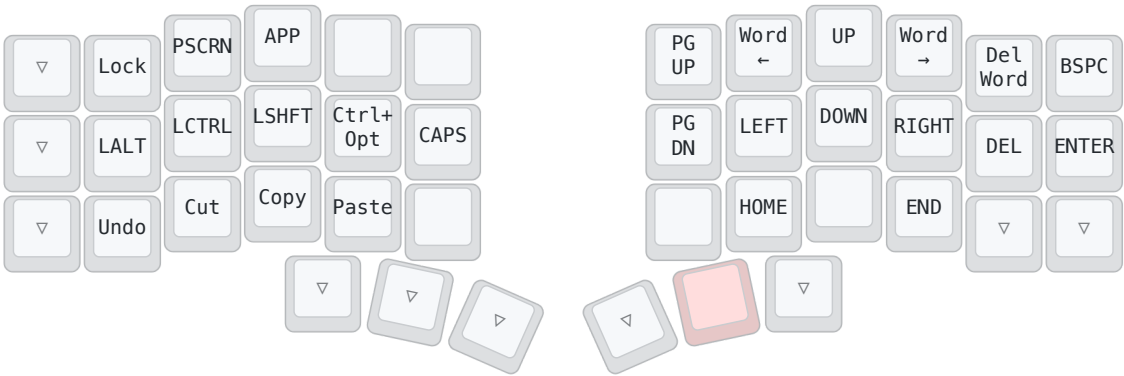

Layer access

LAYER	HOW
NAV	hold right middle thumb (tap = Backspace)
SYM	hold left middle thumb (tap = Space)
ADJ	hold both NAV and SYM together
MOUSE	rest a finger on the trackpad (held while touching)

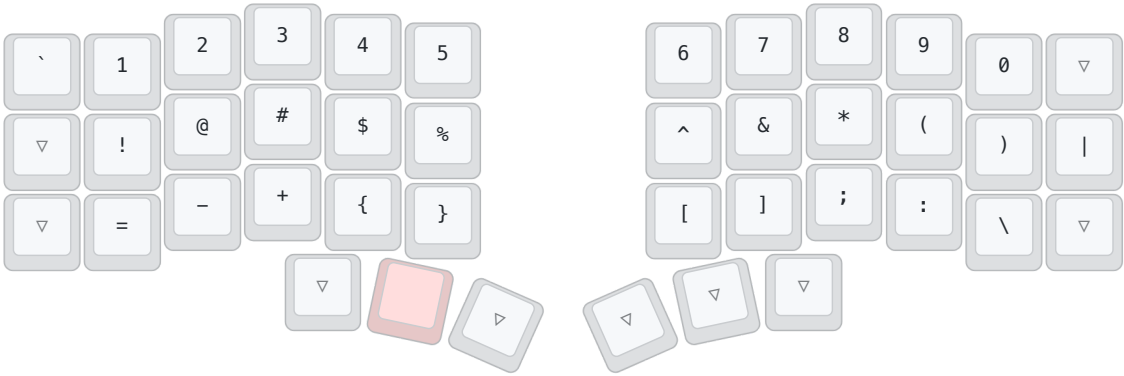

BASE

NAV

SYM

ADJ
